B4A DATA & AI PLAYGROUND
B4A DECISION INTELLIGENCE

PRODUCT XDC-02 · ANY ORGANIZATION · ANY SECTOR

FIXED FEE · REMOTE · ANY SECTOR

The Reporting Audit.

Which of our reports actually drive decisions, and which just consume the month? Most organizations produce more reports than anyone reads and fewer than anyone needs. We inventory everything you produce, trace each report to the decision it serves, and hand back a reporting pack a leader can actually run on.

1
inventory of everything you produce

10
working days, fixed fee

Keep, fix, retire
the verdict on every report

1
redesigned executive pack

WHAT YOU GET

A full reporting inventory. Every report, dashboard and pack you produce, who makes it, how long it takes, who reads it.

A decision map. Each report traced to the decision it serves. A report that serves none is named, with the hours it costs.

A keep, fix, retire verdict. What stays, what gets redesigned, what stops this month, with the time handed back made explicit.

A redesigned executive pack. One page per audience: board, leadership, program or operations, built on your own numbers.

The gap list. The decisions nobody is reporting on, which is usually where the money leaks.

HOW IT WORKS

01

Send a note. The decision you face and the data you hold.

02

A 30-minute call. Frame the question, agree the scope.

03

10 working days. AI explores, people decide, sources shown.

WHO IT IS FOR

CEOs, Executive Directors, COOs and finance leads in any sector whose teams spend days each month assembling packs, while the leadership question that matters still gets answered from memory.

WHAT THE AUDIT FINDS

A typical month of reporting

How your data becomes a decision.

You hand over simple exports, nothing more. AI does in hours what would take an analyst weeks: scanning every record, pattern and comparison at once. People then check what matters against the source, and you receive a clear recommendation, not a pile of tables.

Step 01

What we collect

A list of the reports you produce, a sample of each, and a short interview with the people who make them and the people meant to read them.

Step 02

AI explores at scale

AI reads the whole stack at once: overlaps, orphans, contradictions between reports, and the questions no report answers. Weeks of review in hours.

Step 03

People decide what is true

Every figure that matters is traced back to your records. A person reviews the findings and writes down what the data cannot tell you.

Step 04

You decide with confidence

A reporting pack sized to the decisions you actually make, and the assembly time handed back to the team.

Data becomes information, information becomes knowledge, and knowledge becomes a decision. AI does the sorting at a speed and scale no team can match. People decide what the numbers mean. That split is fixed, and it is why you can trust the result.

Your data stays yours.

No identifiable data leaves your systems. We work from aggregated exports: groups, segments and totals, never individual donors or clients.

Never used to train AI models. Your data is used for your project only, inside tools with training switched off.

Agreed before anything moves. What data is shared, where it is held and who sees it is written down before work begins.

Deleted when you ask. Working copies are removed at the end of the engagement, on request, with confirmation.

Why it matters: the people you serve trusted you with their information. Our method is built so that trust is never put at risk, and your privacy officer can verify every step.

Ethical AI, in writing.

People stay accountable. A named person signs off before anything reaches you or your board.

Numbers come from sources, never from the model. AI explores and compares; it never supplies a figure of its own.

We say where AI was used. In plain words, in every report, and on request at any time.

We say what the data cannot show. Every analysis carries its limits. An average is not anyone's odds.

No harm. No invented numbers or people, and stories about people are told with dignity.

Part of something bigger. The Reporting Audit is the first X-ray of your Decision Layer: it shows which nerves are connected to nothing, and where the next product should plug in.

AI explores · People decide · Primary sources only
