B4A DATA & AI PLAYGROUND
B4A DECISION INTELLIGENCE

PRODUCT XDC-03 · ANY ORGANIZATION · ANY SECTOR

FIXED FEE · REMOTE · ANY SECTOR

The Data Audit.

What data do we actually hold, can we trust it, and what could it answer that we never ask? Before dashboards, before AI, before any of it: an honest map of the data you already own, where it lives, what state it is in, and the questions it could answer tomorrow if it were connected.

1
map of every data source you hold

10
working days, fixed fee

Trust rating
per source, with the fixes ranked

5
questions your data could answer now

WHAT YOU GET

A data inventory. Every system, spreadsheet and export: what it holds, who owns it, how current it is.

A trust rating per source. Where the numbers are solid, where they contradict each other, and the fixes ranked by effort.

The silo map. Which sources talk to each other and which sit alone, shown so a board understands it in one look.

Five questions you could answer now. Real decisions your existing data could already support, no new systems required.

The build order. If you do connect it: what first, what next, what to leave alone. In plain language.

HOW IT WORKS

01
Send a note. The decision you face and the data you hold.

02
A 30-minute call. Frame the question, agree the scope.

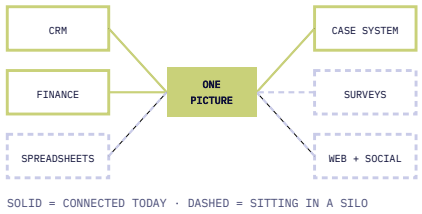

03
10 working days. AI explores, people decide, sources shown.

WHO IT IS FOR

Leaders in any sector who suspect the organization is sitting on more answers than it uses, and want an honest, outside read before spending on dashboards, systems or AI.

WHAT THE AUDIT MAPS

Your sources, connected and siloed

SOLID = CONNECTED TODAY · DASHED = SITTING IN A SILO

ILLUSTRATIVE, FICTIONAL DATA · YOUR VERSION IS BUILT FROM YOUR RECORDS

How your data becomes a decision.

You hand over simple exports, nothing more. AI does in hours what would take an analyst weeks: scanning every record, pattern and comparison at once. People then check what matters against the source, and you receive a clear recommendation, not a pile of tables.

Step 01

What we collect

A guided inventory with your team: what systems exist, sample exports from each, and the questions leadership wishes it could answer.

Step 02

AI explores at scale

AI profiles every export at once: coverage, gaps, duplicates and contradictions between systems. People judge what it means and what to trust.

Step 03

People decide what is true

Every figure that matters is traced back to your records. A person reviews the findings and writes down what the data cannot tell you.

Step 04

You decide with confidence

A map your board understands, a trust rating per source, and a build order that starts with value, not plumbing.

Data becomes information, information becomes knowledge, and knowledge becomes a decision. AI does the sorting at a speed and scale no team can match. People decide what the numbers mean. That split is fixed, and it is why you can trust the result.

Your data stays yours.

No identifiable data leaves your systems. We work from aggregated exports: groups, segments and totals, never individual donors or clients.

Never used to train AI models. Your data is used for your project only, inside tools with training switched off.

Agreed before anything moves. What data is shared, where it is held and who sees it is written down before work begins.

Deleted when you ask. Working copies are removed at the end of the engagement, on request, with confirmation.

Why it matters: the people you serve trusted you with their information. Our method is built so that trust is never put at risk, and your privacy officer can verify every step.

Ethical AI, in writing.

People stay accountable. A named person signs off before anything reaches you or your board.

Numbers come from sources, never from the model. AI explores and compares; it never supplies a figure of its own.

We say where AI was used. In plain words, in every report, and on request at any time.

We say what the data cannot show. Every analysis carries its limits. An average is not anyone's odds.

No harm. No invented numbers or people, and stories about people are told with dignity.

Part of something bigger. The Data Audit maps the Senses of your Decision Layer: what the organization can currently feel, and where it is numb. Every later product builds on this map.

AI explores · People decide · Primary sources only
